

# Introducing WebCatalog 7

Quang Lam

Oct 2, 2017 · 2 min read · Unlisted

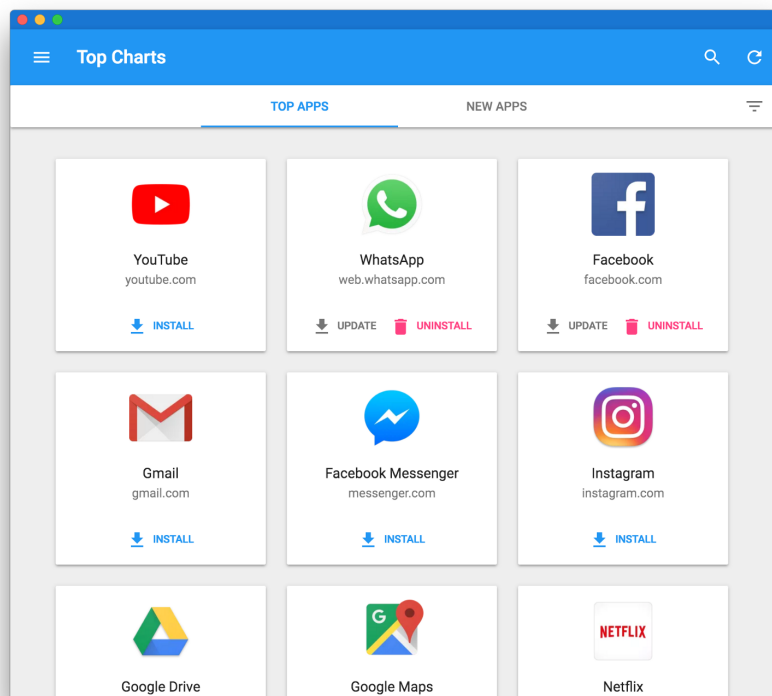

Running thousands of web apps like real apps just got better and easier. WebCatalog 7.0 is now available.

A few months ago, we started building WebCatalog from scratch to provide a simpler, more unified experience. Since then, we've redesigned the app, rebuilt the core components and fixed many bugs. Here's an overview of what you'll see in 7.0.

## Material Design

Inspired by Google's beautiful design language, we completely changed WebCatalog's appearance.

...

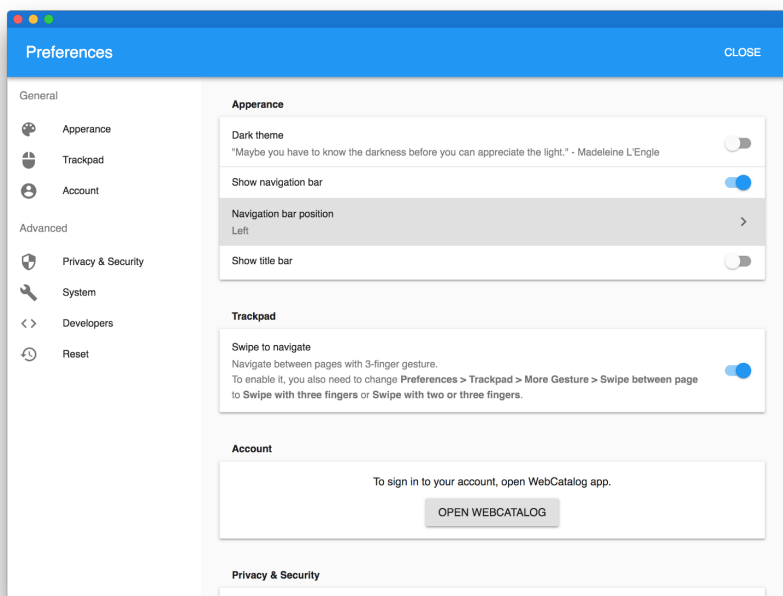

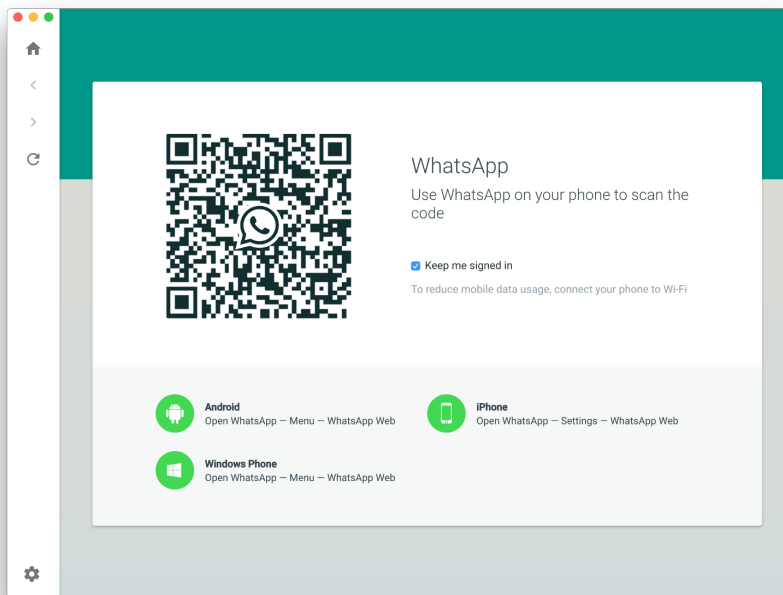

## Molecule

To move the app development forward, we decided to rebuild the engine powering WebCatalog Apps. We named it Molecule.

With Molecule:

- WebCatalog Apps now run independently from WebCatalog. It means you can uninstall or move WebCatalog to external storage without affecting those apps.
- Notifications now work properly.
- Many critical bugs are fixed.

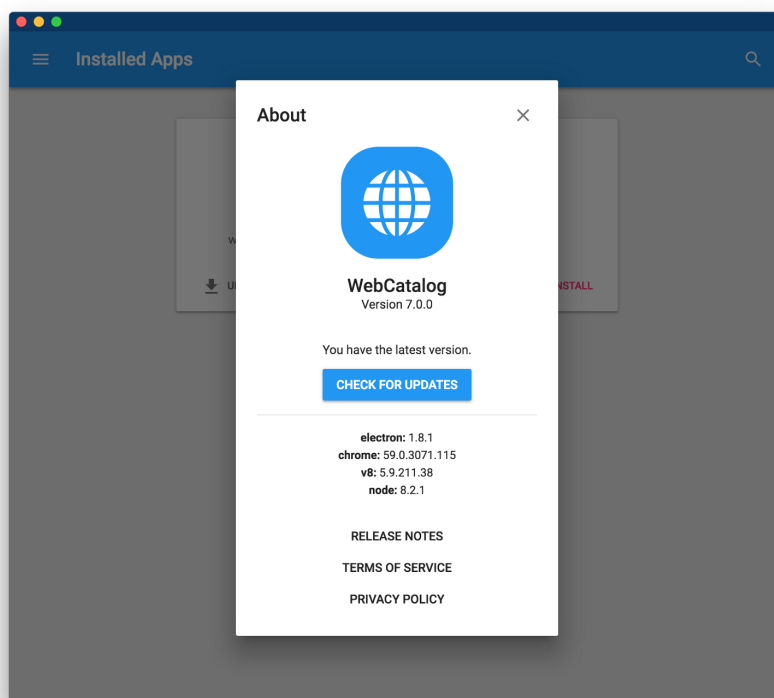

We also added Dark Mode, Navigation Bar Toggle, etc. And we planned to add many more features in the upcoming updates.

• • •

## Auto Update

WebCatalog 7+ will download and install new update in background!

• • •

## Legacy App

WebCatalog is a very big update. And even though we try our best to ensure everything works as expected, it is not perfect. But don't worry, we won't force you to update! If you have good reasons to keep WebCatalog 6, you can continue to use them and move over to the new app when you're ready.
