

# WebCatalog 12

Quang Lam

Apr 3, 2018 · Unlisted

As WebCatalog grows, it has become buggy and unmaintainable. I made the situation even worse by introducing new, half-baked products based on WebCatalog and then renaming WebCatalog over and over again.

In the last a few weeks, I worked to resolve these issues. As a result, I've made some changes to simplify and unify the product:

- **WebCatalog Lite** is renamed to **WebCatalog**. If you are using WebCatalog Lite, you don't need to do anything. Just use the integrated updater to update the app.
- WebCatalog version number is bumped to **12.0.0**.
- **Juli 2+** no longer works as a standalone app but will act as an application framework. You can use WebCatalog and pick Juli as your preferred engine. Thanks to this approach, the update process is much simpler. You will no longer need to update all your installed apps manually but will only need to update Juli. **If you are using Juli, make sure to Juli 1.3.1 and before to remove all of your Juli Apps before upgrading to Juli 2.**
- WebCatalog will be a freemium app. The free version allows up to install up to **two** apps. To install **as many apps as you want**, please purchase a license.

If you have any questions or feedback, feel free to email me or create a GitHub issue. Thank you very much for supporting the app!
